

PRESS RELEASE

Veripress 7.0 announced.

SYDNEY, Australia - March 14, 2016 - Serendipity Software today announced version 7.0 of Veripress, a maintenance release with numerous bug fixes and enhancements.

"Veripress version 7.0 adds support for v7 security dongles. These driverless dongles will make installation of the software even easier" said Peter Skarpetis, Serendipity Software's Chief Executive Officer. V7 dongles speed up server startup times. Existing dongles are still supported and able to be updated as required.

Veripress version 7.0 improves the colour management of the Linux version. It can now configure and use operating system wide ICC profiles using 'colord'. Generated monitor ICC profiles now include a video card gamma LUT for improved colour fidelity.

Veripress version 7.0 includes a new, highly optimised, random number generator which further reduces patterns appearing in screening and CMS dither tasks, in addition to improving the performance of tasks which rely on random numbers.

Veripress version 7.0 improves on the scheduling of periodic tasks to further reduce the latency of processes such as RIP and Bookfilter polling.

For more information on the new features and enhancements in Veripress 7.0 see the release notes available on the Serendipity Software website.
